

Assignment XYZ123

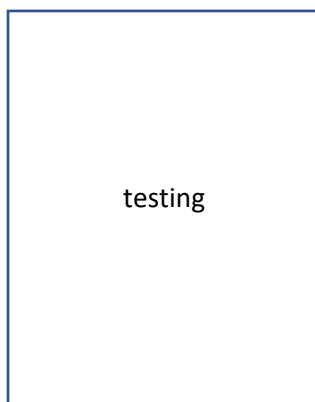

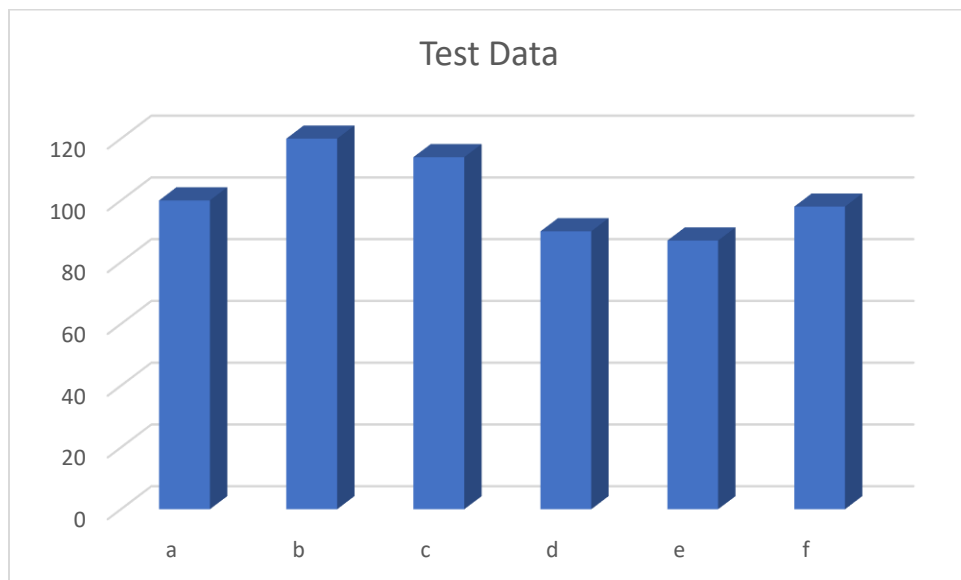

Welcome to Watermarker. This document is a sample assignment used to demonstrate Watermaker.

Watermarker will take this file and a list of students (in csv format), and output a pdf for each student with a watermark and ID.

This method of distributing assignments can help to mitigate posting online to services such as Chegg. The output assignments are automatically emailed to each student. Since each of these files has a personalized watermark, if post, this document will be traceable to a specific student.

Each document is encrypted and protected from editing and printing. To view the assignment, the student must enter a supplied password (you can set a unique password per user). Since the document sent to students is protected, If the student attempts to remove the watermark via acrobat, they will be blocked from doing so.

Students can always write a copy of the assignment by hand; therefore, this scheme works best when 1) time period is shorter, and 2) the assignment question is sufficient long, or includes things like diagrams.
